Amendments to the Claims

The following list of claims with replace all prior versions and listings of claims in the present application:

Claims:

Claims 1-23 (Cancelled)

Claim 24. (Currently amended) A composition for animal consumption comprising:
an animal feed substrate; and
one or more coated particles,
whereby said substrate and said coated particles are intimately mixed and pressed into tablets or pellets of suitable size for feed consumption, and
whereby said coated particles comprise:
a carrier material having an average diameter of approximately 0.09 mm to 0.8 mm, whereby said carrier material is selected from the group consisting of starch, saccharose, and lactose;
a first coat comprising an active ingredient casing consisting essentially of benazepril; and
a second coat comprising a physiologically compatible cationic polymer matrix, ~~The composition of Claim 21~~ whereby said physiologically compatible cationic polymer matrix is an acrylic acid polymer or a methacrylic acid polymer or a combination of said polymers.

Claim 25. (Currently Amended) The composition of Claim [[21]]24 further comprising one or more additives whereby said additives are selected from the group consisting of proteins, vitamins, minerals, artificial aromatics, and natural aromatics.

Claim 26. (Currently Amended) The composition of Claim [[21]]24 whereby said substrate is yeast.

Claim 27-31. (Cancelled)

Claim 32. (Currently amended) A method of making an animal medicament comprising mixing benazepril with a solvent;

coating a carrier material with the benazepril dissolved in a solvent, whereby said carrier material has an average diameter of approximately 0.09 mm to 0.8 mm, and whereby said carrier material is selected from the group consisting of starch, saccharose, and lactose;

coating said benazepril-coated carrier material with an additional cationic masking protective layer to form multi-coated particles, ~~The method of Claim 29~~ whereby said cationic masking protective layer is an acrylic acid polymer or a methacrylic acid polymer or a combination of said polymers;

intimately mixing said multi-coated particles with a substrate whereby said substrate consists of animal feed; and

compressing said intimately mixed coated particles and substrate into tablets or pellets of appropriate size for feed consumption.

Claim 33. (Currently Amended) The method of Claim [[29]]32 further comprising adding one or more additive to said intimately mixed coated particles and substrate whereby said additive is selected from the group consisting of proteins, vitamins, minerals, artificial aromatic substances, and natural aromatic substances.

Claim 34. (Currently Amended) The method of Claim [[29]]32 whereby said substrate is yeast.

Claim 35. (Cancelled)

Claim 36. (Cancelled)

Claim 37. (Currently Amended) The composition of Claim [[21]]24 whereby the carrier material has an average diameter of approximately 0.15 mm to 0.4 mm.

Claim 38. (Previously Presented) The composition of Claim 24 whereby the cationic polymer is based on dimethylaminoethyl methacrylate and neutral methacrylic esters.

Claim 39. (Currently Amended) The method of Claim [[29]]32 whereby the carrier material has an average diameter of approximately 0.15 mm to 0.4 mm.

Claim 40. (Previously Presented) The method of Claim 32 whereby the cationic polymer is based on dimethylaminoethyl methacrylate and neutral methacrylic esters.

Claim 41. (Cancelled)

Claim 42. (Currently Amended) A composition for animal consumption comprising:
an animal feed substrate; and
one or more coated particles,
whereby said substrate and said coated particles are intimately mixed and pressed into tablets or pellets of suitable size for feed consumption, and
whereby said coated particles comprise:
a carrier material having an average diameter of approximately 0.09 mm to 0.8 mm, whereby said carrier material is selected from the group consisting of starch, saccharose, and lactose;
a first coat comprising an active ingredient casing consisting essentially of benazepril; and
a second coat comprising a physiologically compatible pH-dependent cationic polymer matrix capable of dissolving at an acidic pH value of up to pH 5.0, ~~The composition of Claim 41~~ whereby said physiologically compatible cationic polymer matrix is an acrylic acid polymer or a methacrylic acid polymer or a combination of said polymers.

Claim 43. (Previously Presented) The composition of Claim 42 whereby the cationic polymer is based on dimethylaminoethyl methacrylate and neutral methacrylic esters.

Claim 44. (Currently Amended) The composition of Claim [[41]]42 further comprising one or more additives whereby said additives are selected from the group consisting of proteins, vitamins, minerals, artificial aromatics, and natural aromatics.

Claim 45. (Currently Amended) The composition of Claim [[41]]42 whereby said substrate is yeast.

Claim 46. (Currently Amended) The composition of Claim [[41]]42 whereby the carrier material has an average diameter of approximately 0.15 mm to 0.4 mm.

Claim 47. (Cancelled)

Claim 48. (Currently Amended) A method of making an animal medicament comprising mixing benazepril with a solvent;
coating a carrier material with the benazepril dissolved in a solvent, whereby said carrier material has an average diameter of approximately 0.09 mm to 0.8 mm, and whereby said carrier material is selected from the group consisting of starch, saccharose, and lactose;
coating said benazepril-coated carrier material with an additional cationic polymer masking layer wherein the cationic polymer masking layer is pH-dependent and capable of dissolving at an acidic pH value of up to pH 5.0 to form multi-coated particles and ~~The method of Claim 47~~ whereby said cationic polymer masking protective layer is an acrylic acid polymer or a methacrylic acid polymer or a combination of said polymers;
intimately mixing said multi-coated particles with a substrate whereby said substrate consists of animal feed; and
compressing said intimately mixed coated particles and substrate into tablets or pellets of appropriate size for feed consumption.

Claim 49. (Previously Presented) The method of Claim 48 whereby the cationic polymer is based on dimethylaminoethyl methacrylate and neutral methacrylic esters.

Claim 50. (Currently Amended) The method of Claim [[47]]48 further comprising adding one or more additive to said intimately mixed coated particles and substrate whereby said additive is selected from the group consisting of proteins, vitamins, minerals, artificial aromatic substances, and natural aromatic substances.

Claim 51. (Currently Amended) The method of Claim [[47]]48 whereby said substrate is yeast.

Claim 52. (Currently Amended) The method of Claim [[47]]48 whereby the carrier material has an average diameter of approximately 0.15 mm to 0.4 mm.
